

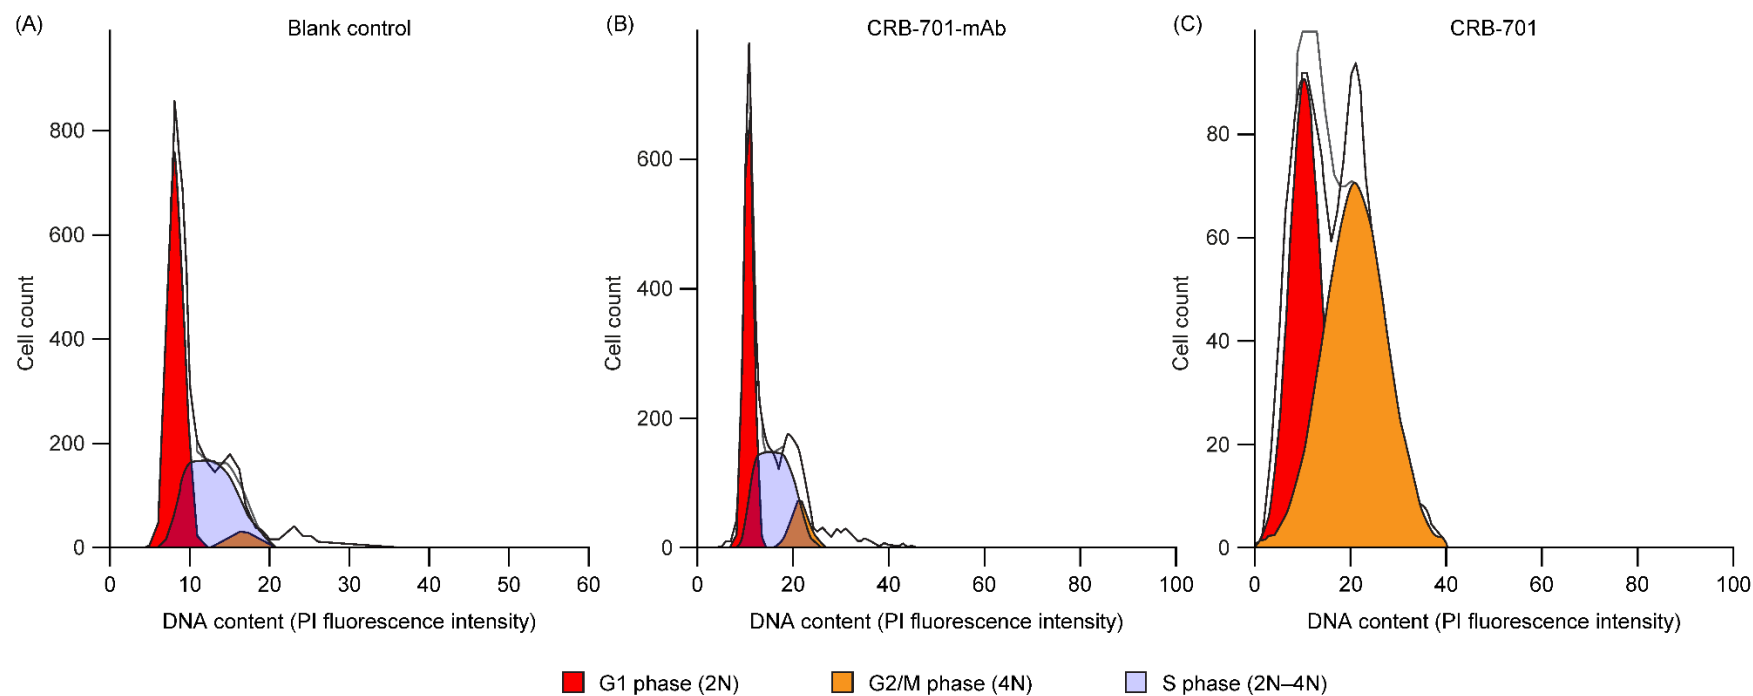

Figure S6. Cell cycle analysis of 293T-NECTIN4 cells by flow cytometry using PI staining. Cells were treated with (A) blank control (cell culture medium), (B) 10 $\mu\text{g/mL}$ CRB-701-mAb or (C) 10 $\mu\text{g/mL}$ CRB-701 for 66 ± 3 hours. Fluorescence intensity histograms were fitted to a cell cycle distribution model based on chromosomal content: G1 phase (2N), S phase (2N–4N), and G2/M phase (4N).

mAb, monoclonal antibody; PI, propidium iodide.
