

Figure S8. (A) Bystander-mediated cytotoxicity of CRB-701 or CRB-701-mAb in 293T-NECTIN4 and PC-3-NECTIN4 cells as determined by luciferase assay. A reduction in luminescence indicates a reduction in the viability of cocultured HEK293-LUC cells. Data are presented as mean $\pm$ SDs of three technical replicates. (B) Dose-response analysis of CRB-701 and CRB-701-mAb bystander-mediated cytotoxicity in PC-3-NECTIN4 cells. Data were fitted using a four-parameter sigmoidal model, yielding an IC_{50} of 1.3×10^{-7} g/mL (130 ng/mL). No cytotoxicity was observed in parental 293T cells at up to 833 ng/mL CRB-701 (**Fig. S4**).

IC_{50} , concentration required to produce 50% maximal inhibition; mAb, monoclonal antibody; RLU, relative light unit; SD, standard deviation.
